

# D-Lev

DIGITAL THEREMIN

***“Invented in New Jersey”***

***by***

***Eric Wallin***

# About Me

---

- Since teens: EE hobbyist, folk guitar
- Variety of manufacturing and engineering adjacent jobs, unfortunately mostly mechanical
- BSEE & MSEE (UVA)
- Lucent brought me to beautiful Boonton in 1998
- Decade of Telecom FPGA digital design work
- Took the package to work on my HIVE soft processor

# FPGA

---

- **Field Programmable Gate Array**
- **Sea of digital logic interconnected via switches**
- **Programmed using HDL (Hardware Description Language)**
- **Slow & power hungry, often a solution in search of problem**
- **Good match w/ Theremin (accident waiting to happen)**

# The Theremin

- One of very first electronic musical instruments
- Invented 1919 by Leon Theremin
- Capacitive fields for pitch and volume, no physical contact
- Notoriously difficult to play
- Constrained by physics
- Originally “Etherphone” then “Termenvox”

# The Theremin

---

- Similar to some 1950's metal detectors
- Can be made from a handful of parts (e.g. Moog Melodia)

# Leon Theremin

---

- Born *Lev Sergeyevich Termen* 1896 Russia
- Conservatory cellist
- Degree in physics / EE
- Lenin demonstration in 1922
- Toured the world
- Played the Met in 1928, stayed in US
- Patented the Theremin in 1928
  - Sold rights to RCA, 500 units @ \$3k
- Developed other instruments:
  - Terpsitone, Theremin Cello, Rhythmicon

# Leon Theremin

- Debt, bad investments
- Returned to the Soviet Union in 1938
- Stalinist purge, imprisoned until 1947
- Oppressive government surveillance
- Spy technology (“The Thing”)
- Died 1993 (age 97) in Moscow
- *Theremin: An Electronic Odyssey*
- *Theremin: Ether Music and Espionage*

# Robert Moog

---

- Towering figure in synth world
  - Modular, Mini-Moog, etc.
- Born in 1934 NYC
- BS, BSEE, PhD in EE & Physics
- Built first Theremin at age 14
- Designed & published his own in 1953
- Funded college selling kits & parts
- One patent (ladder filter)
- Died 2005 (age 71) leaving a vacuum

# Moog Theremins

- Several early tube models
- Melodia 1961
- Big Briar 1991
- Etherwave 1996
- Ethervox 1998

# Moog Etherwave Pro

- 2004 state of the art
- Bob's final design
- Good linearity
- No MIDI?
- Questionable ergonomics
- Fragile, almost museum piece
- 1500 made, scarce, pricey

# Theremin Capacitance Sensing

- Operates in Reactive Near Field
- LC oscillator good trade-off of sensitivity vs. stability, Q boost
- Usually  $< 1\text{MHz}$  operation (VLF)
- “Antenna” very short for the wavelength  $\Rightarrow$  “electrode”
- Very weak RF emissions
- Must be highly responsive, no perceptible lag (100Hz / 10ms)
- Must reject mains hum, RF, etc.

# Antenna & Hand Capacitance

---

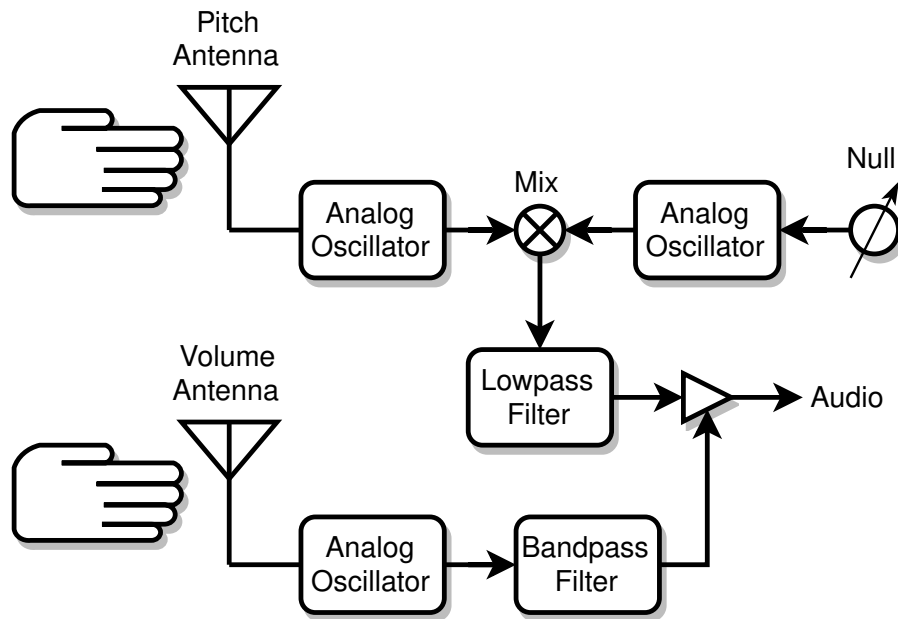

- One hand alone is 10pF (with the universe – intrinsic)
- Hand 24 & 12 inches away, capacitance is 0.2pF & 1.2pF
- $1.2\text{pF} - 0.2\text{pF} = 1\text{pF}$  difference
- Need to measure 1/1000 this (femto-Farads!) for musical control
- One millionth billionth of a Farad!
- Amazing it works at all (stable, responsive)

# Analog vs. Digital

- Analog fields & audio generation locked together

- Digital fields & audio generation independent

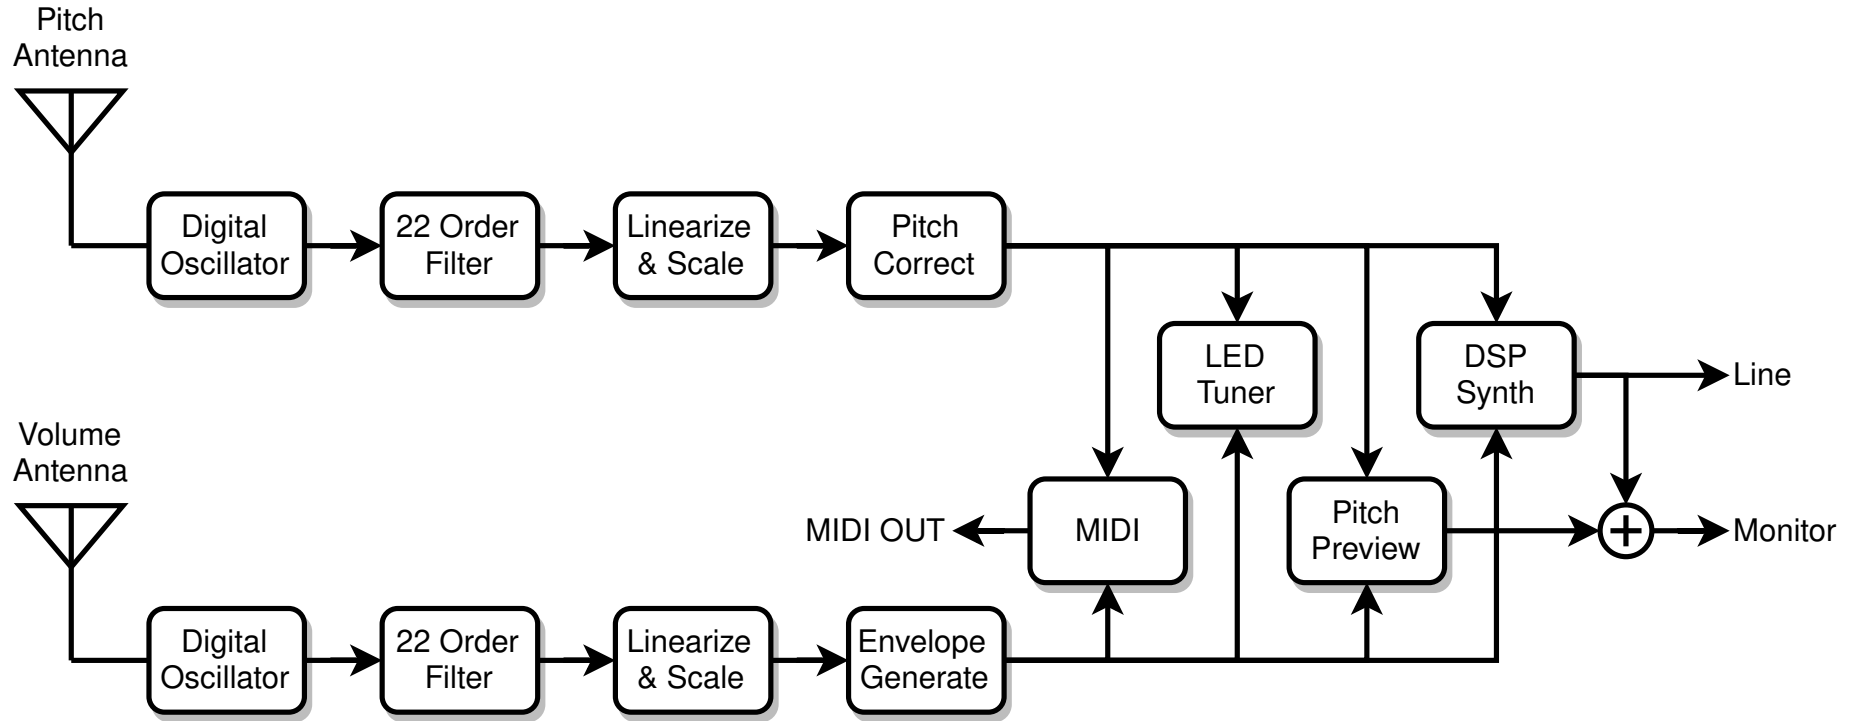

# The D-Lev

- D(igital)-Lev (Termen)
- 2012 to present (!)
- Linear / shaped fields
- Pitch & volume display
- Pitch correction
- Modal synthesis
- Hive soft processor
- FPGA hardware basis
- Open source

# D-Lev Architecture

---

# Fields Linearization

- Linear pitch field a holy grail
- Method discovered by me in 2017
- A form of gamma correction:  $y = x^{0.25}$

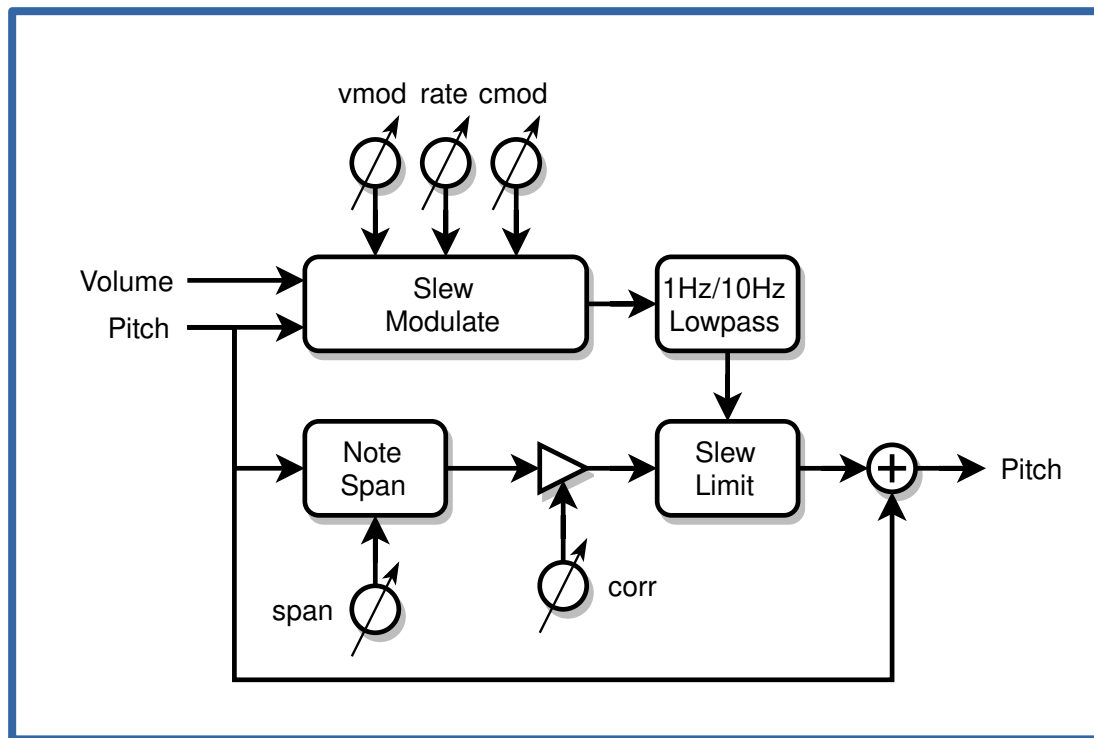

# Volume Field Shaping

- Short shrift from designers
- Linear basis
- Linear response not desirable
- Knee: linear gain break
- Drop: 2<sup>nd</sup> order non-linear curve

# Pitch Correction

- Controversial – virtuosity lost with “Auto-Tune” overuse
- Theremin crying out for it
- 90% just slowed quantization
- Aggressive but unobtrusive
- Note center rate modulation
- Bi-modal filter for smooth glissando
- Volume rate modulation
- Chromatic only
- Requires absolute reference

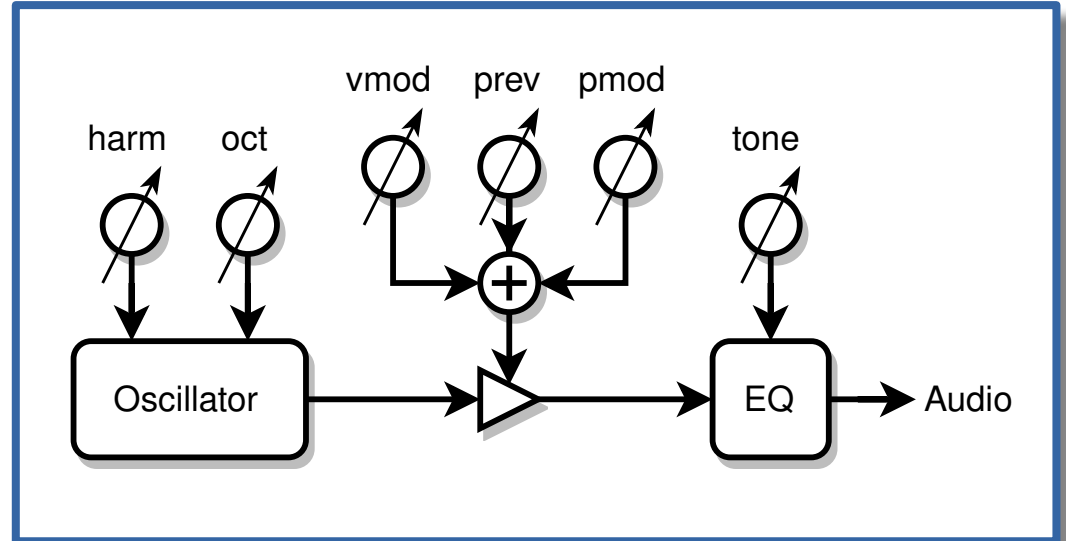

# LED “Tuner”

- Responsive display of pitch & volume
- Real-time feedback
- Come in on pitch after silence
- Patterns reveal key
  - *Crown & House*

# Pitch Preview

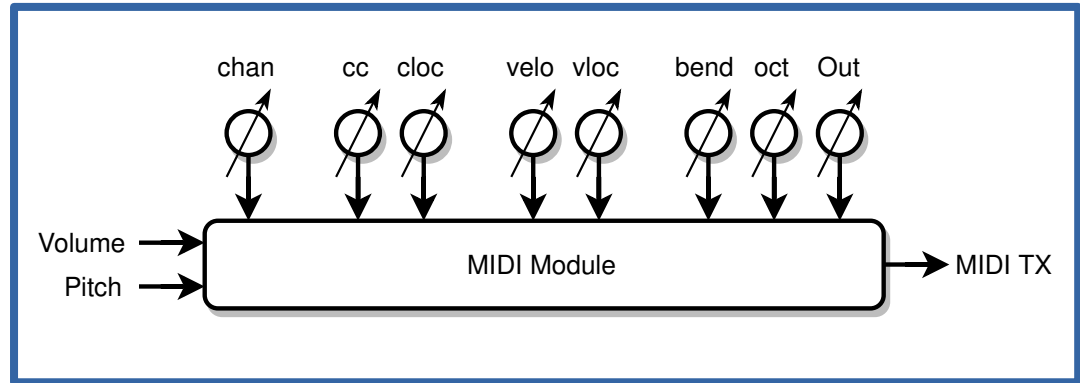

- **Player pitch monitor**
- **Come in on-pitch after silence**
- **Pro feature**
- **Largely unnecessary when tuner present**
- **4<sup>th</sup> oscillator / DC stimulus when unused**

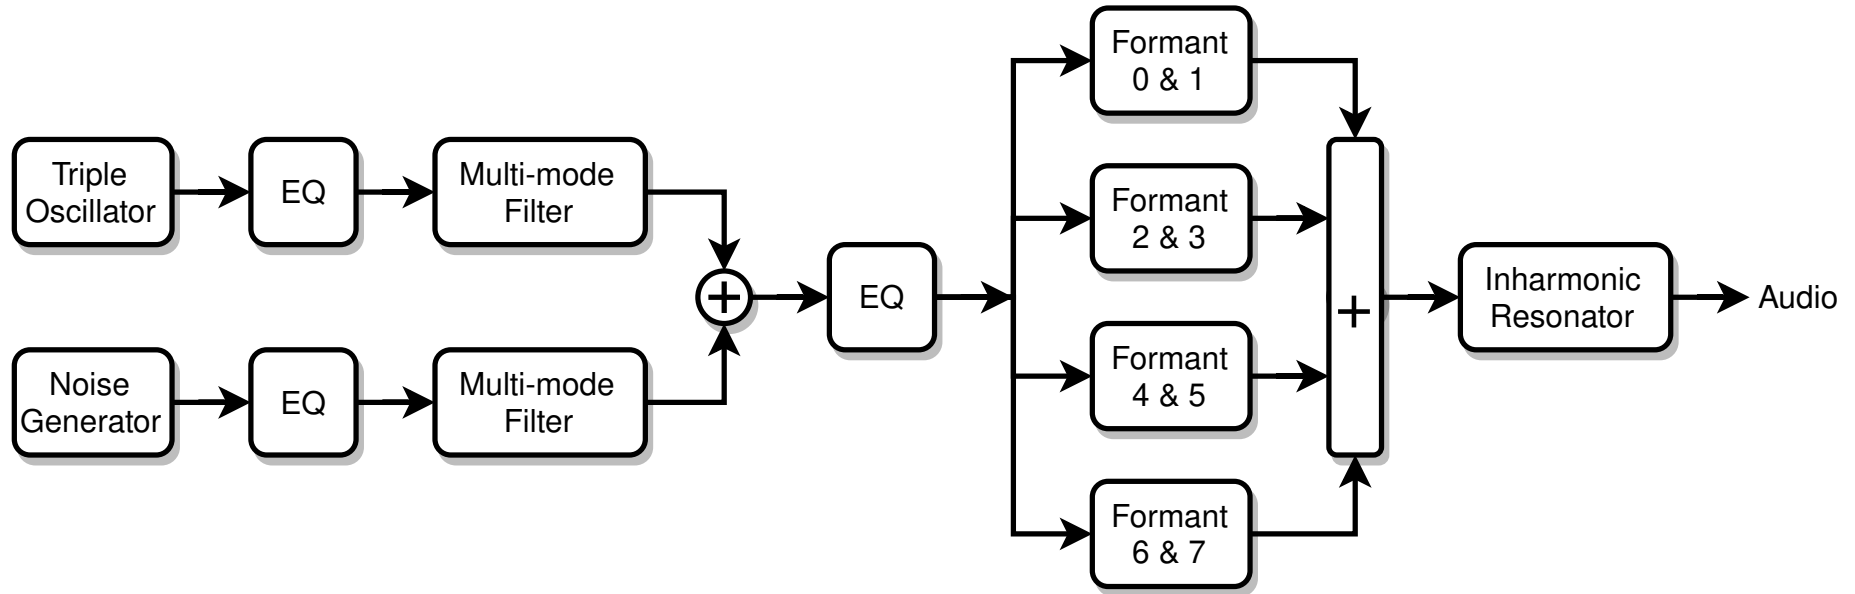

# MIDI Module

- Musical Instrument Digital Interface (1983)
- Transmit only (no RX)
- Sends pitch & volume hand information to external synth
- Note on/off, velocity, pitchbend, CC, 7/14 bit
- More full-featured than most
- Can be used in tandem with D-Lev synth

# D-Lev DSP Synthesizer

- VOCALS, strings, brass, woodwinds, bells, animals, UFOs, Theremins, etc.

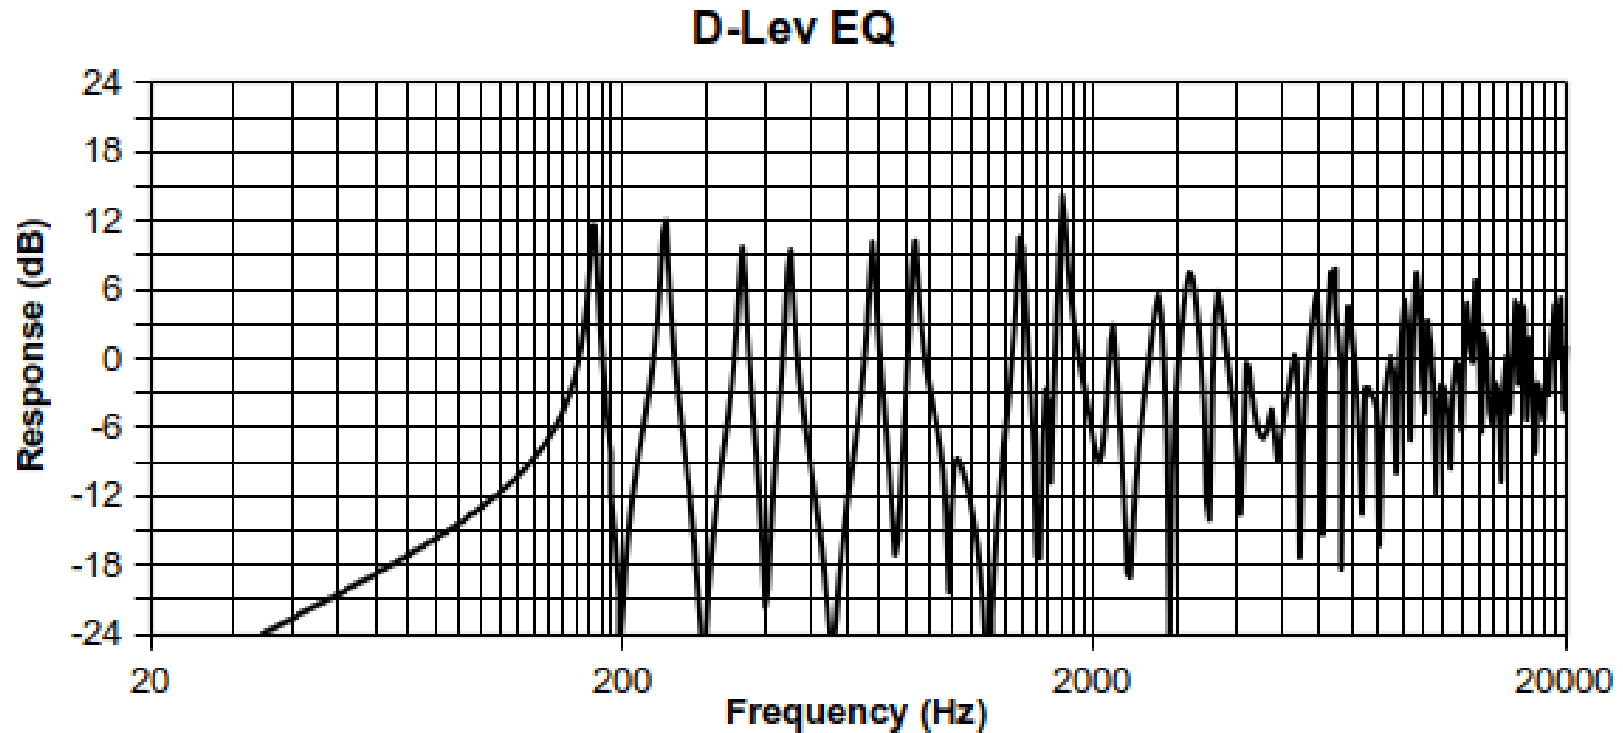

# Modal Synthesis

---

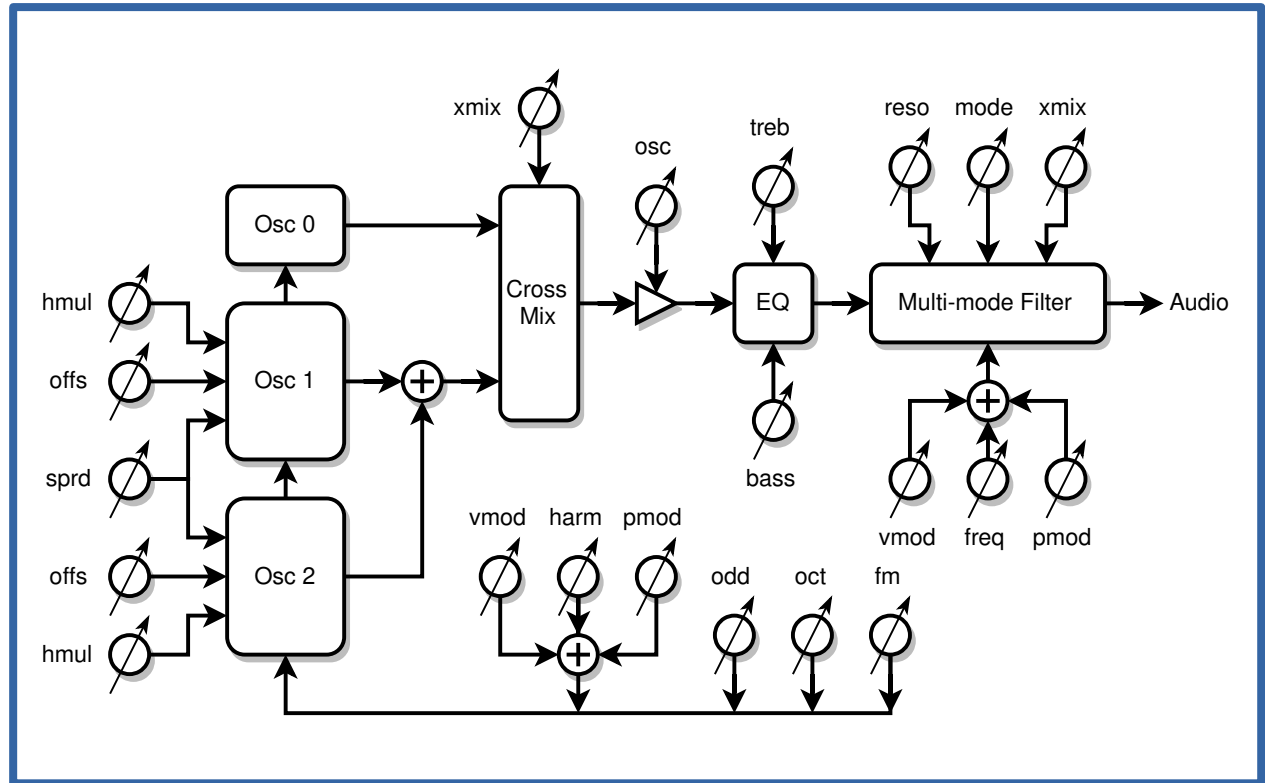

- Simple excitation + a bunch of resonant filters
- Good at mimicking real-world sounds
- Classification of acoustic sources by resonances:
  - Horn: 1
  - Human vocals: 5 to 7
  - Violin / cello: 30 to 100
  - Cymbal: 1000
- D-Lev DSP synth has 8 formant filters
- Inharmonic Resonator upper fill

# Cello Synthesis

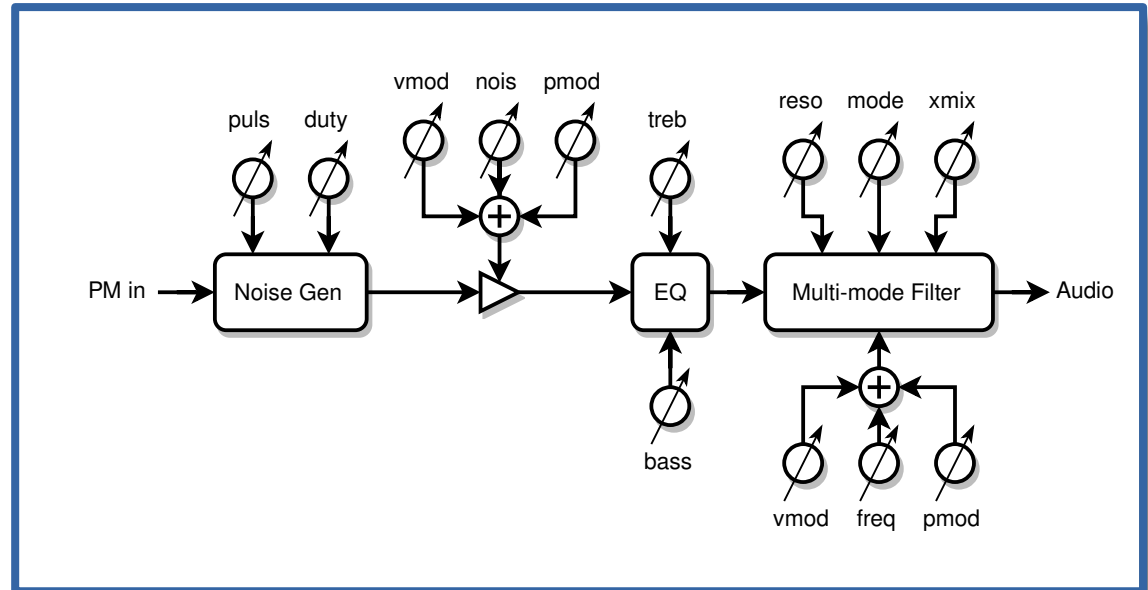

# Triple Oscillator

- Center & two offset
- Reduced alias PM oscillator (1979)
- Patent: US4249447
- All / odd harmonic mix
- Brightness modulation
- FM (cross) & AM (ring) modulation
- EQ (bass & treble)
- Multi-mode filter

# Noise Source

- Pink noise ( $1/f$ ) better basis, easier to EQ
- Voss-McCartney algorithm
- AM “puffs” via Oscillator PM
- EQ (bass & treble)
- Multi-mode filter

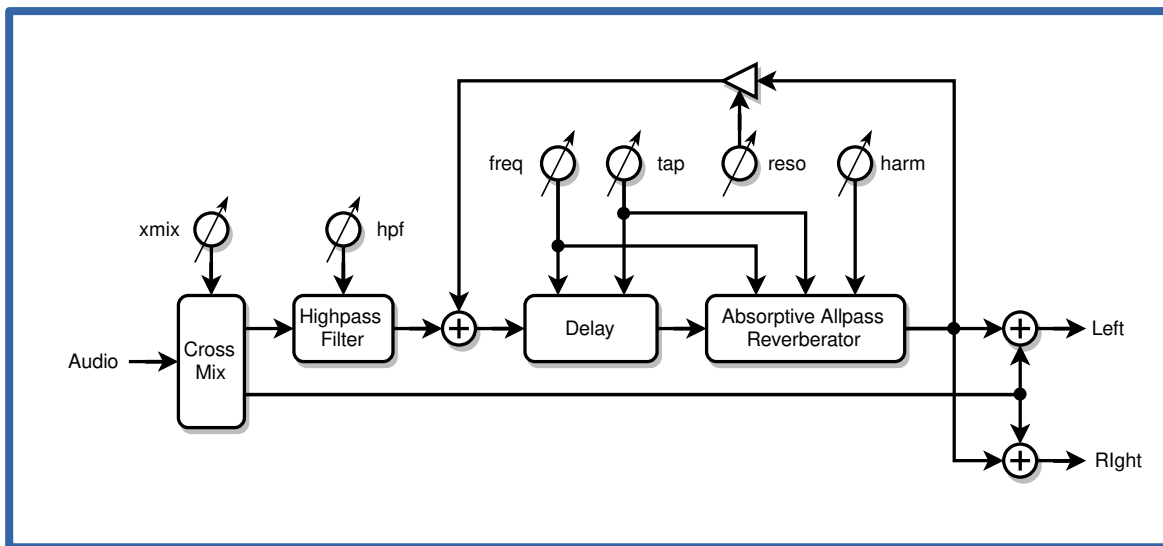

# Formant Bank

- **Eight 2<sup>nd</sup> order band-pass filters in parallel**
- **Chamberlin (1980)**
- **Independent**
  - **Fc (resonance frequency)**
  - **Level**
- **4 pairs each share**
  - **Fc modulation**
  - **Q (resonance)**

# Inharmonic Resonator

- Delay-based filter
- Paper: Jae hyun Ahn & Richard Dudas
- Absorptive all-pass + simple delay, recirculated
- AP breaks up strict harmonic resonance locations
- String body resonances, drums, bells, gongs, human vocals
- Small room ambiance
- Pseudo stereo

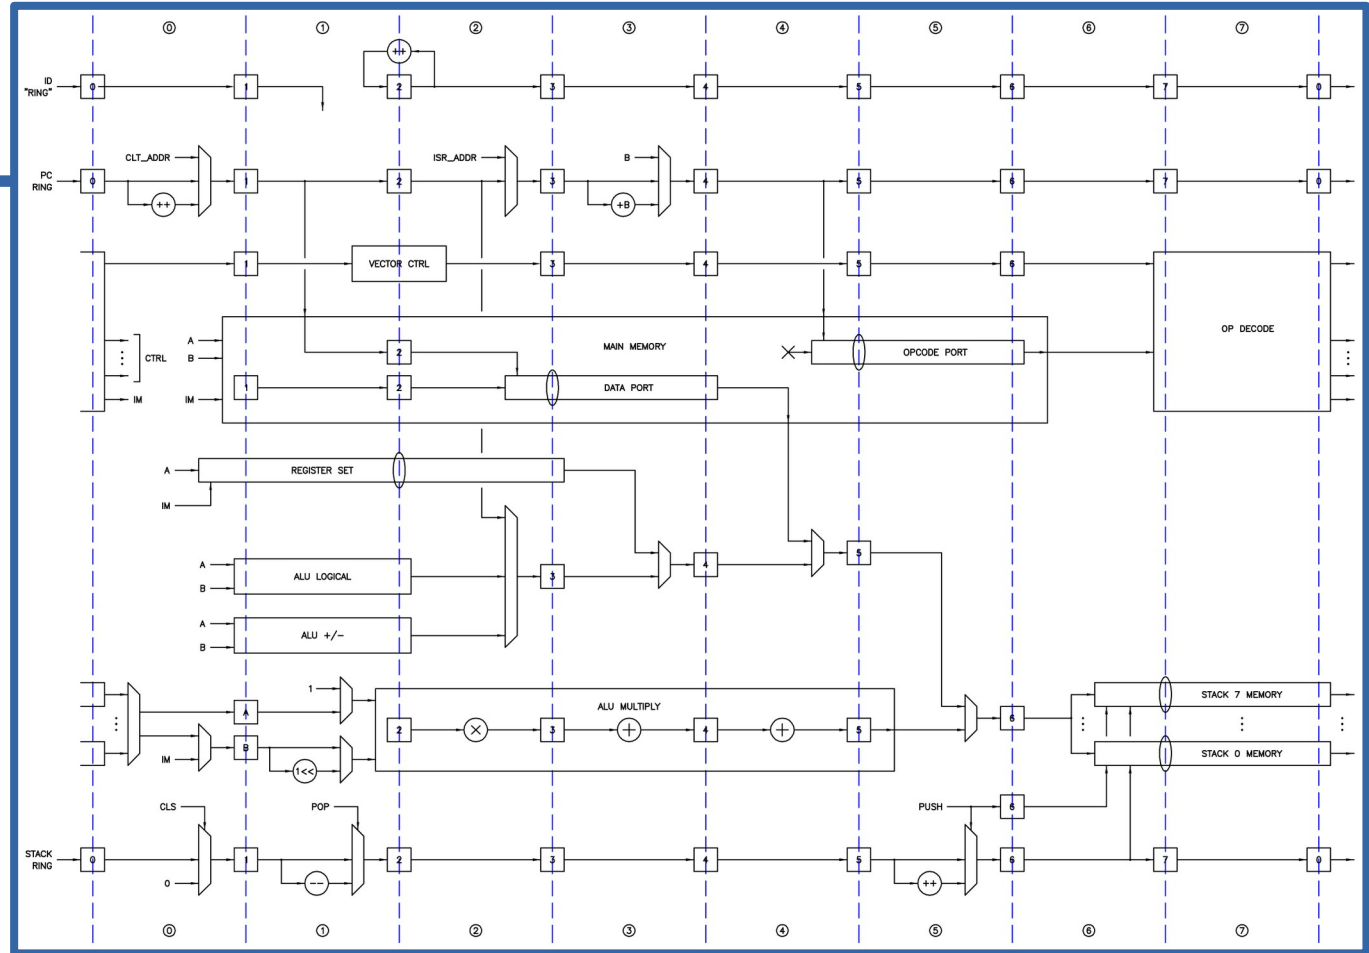

# Presets Creation

---

- **Beauty part: instantaneous setup of entire synth**
- **250 preset slots, 6 system profile slots**
- **Long-term activity, integral to synth development**
- **Synths live & die by their factory presets**
- **Not a sample playback instrument**
- **Spectral analysis + research + mapping to synth = effort**
- **Discovering what makes an instrument “tick”**
- **Various timbres require different playing techniques to sound realistic – stretch exercise**
- **Users can create, modify, save, share presets**

# HIVE

- Barrel pipelined
- 8 threads
- 8 stack set / thread
- 32 bit / 180 MIPS
- 16kB memory
- Tooling:
  - Simulator
  - Assembler & language
  - Integer & float libraries
- Incredibly intense learning experience

# Librarian

- Manage presets
- Update software
- Remote control
- Command line interface (CLI)
- Written in Go
- Win, Mac, Linux, Raspberry Pi, etc.

# **Opportunities = Future Directions?**

---

- **Reversed volume field w/ shaping & velocity**
- **Looser pitch field**
- **Interactive tuner use**
- **Pitch correction**
- **Plates rather than rods**
- **More robust fields**
- **Better ergonomics**
- **Third field for dynamics**

# D-Lev Kit

- Get design out, feedback from builders & players
- Social phase of project
- 46 made, sent all over the world
- Users supply cabinet & antennas
- 1 week to 3D print & build, \$250 parts, 4lbs to ship
- Profit / loss neutral
- Open source
